

EVA-HNS Canonical Overview v1.0

A Structural Full-Stack Architecture for Human Understanding and External AI Verification

Field	Value
Author	Satoru Hara / Natural Structure Works (NSW)
Version	v1.0
Status	Author-led reference document / not a formal standard
Related Corpus	Human Natural Structure Series (Six-Part Publication Set)
Date	2026-06-10

Status Notice. This document is part of the author's own research and publication program. It is not an ISO, IEC, SC42, IEEE, NIST, CEN/CENELEC, or governmental standard. It is provided as a structured reference for review, discussion, implementation planning, and future independent validation.

1. Purpose

This overview provides a compact canonical entry point to the EVA-HNS architecture. It connects the Human Natural Structure six-part series with the seven PoC package and explains how the framework can be read, tested, cited, and extended without overstating its current evidentiary status.

2. One-Sentence Definition

EVA-HNS is a model-agnostic, externally verifiable structural architecture that combines HNS coordinates, SMS-6 grounding, EVA audit logging, and conformance-oriented evaluation to make AI output review more interpretable, traceable, and auditable.

3. Architecture at a Glance

Layer	Role	Primary Function
HNS-36	Base coordinate system	Maps output to Natural Layers and Abstract Categories.
HNS-144	Observational extension	Adds onto-modal quadrants: subjective/objective and necessary/contingent.
HNS-864	Analytical extension	Identifies inference and control operators such as conditioning, intervention, counterfactual, comparator, and attenuation.
HNS-SMS-6	Grounding axis	Checks whether output remains grounded across somatic, protocol, organizational, economic, governance, and universal layers.
EVA	External verification architecture	Produces machine-readable audit records independent of model self-assessment.
ECS/LCS/SOHU	Supporting systems	Provide control, lifecycle, and theoretical grounding for the full-stack architecture.

4. Relationship to the Six-Part Series

Book	Role in the Architecture
Book 1: Origin & Theoretical Foundation	Defines MAV, intellectual lineage, empirical status, and the theoretical origin of HNS.
Book 2: Foundational & Observational Specification	Defines HNS-36 and HNS-144 as the core structural and observational OS.
Book 3: Analytical Specification	Defines HNS-864 and the analytical/inference-control layer.
Book 4: Social Meta-Structure Specification	Defines HNS-SMS-6 as the grounded/executive axis.
Book 5: External Verification Architecture	Defines EVA as the external audit and verification layer.
Book 6: Standards & Conformance Specification	Connects the system to conformance, benchmark, governance, and standards discussion.

5. Relationship to the Seven PoCs

PoC	Primary Demonstration
Auditability PoC	AI output can be mapped to HNS coordinates and EVA audit logs.
Hallucination Taxonomy PoC	Structural AI failures can be classified using the HNS five-

	type taxonomy.
Before / After Constraint PoC	HNS constraints can make output structure easier to compare.
Conformance PoC	EVA-HNS can be represented as checklist-style conformance items.
Post-Hoc Auditor PoC	Already emitted AI output can be audited without changing model weights.
Standards Mapping PoC	EVA-HNS functions can be mapped to auditability, transparency, traceability, risk, and conformance concepts.
Multi-Axis Verification PoC	Fluency, structural validity, and grounding can be evaluated separately.

6. What EVA-HNS Most Securely Claims

- AI output review can be made more explicit by mapping claims to HNS coordinates.
- Structural failure types can be named and logged rather than left as vague judgment.
- EVA can produce an externally inspectable record of what was checked and why.
- Post-hoc auditing can be performed without access to model weights or logits.
- Conformance-oriented checklists can be built from the architecture.

7. What EVA-HNS Does Not Yet Claim

- It does not yet claim independent third-party validation across all models and domains.
- It does not claim universal elimination of hallucination.
- It does not claim that the coordinate system is sufficient for every governance purpose.
- It does not claim formal recognition by any standards body.
- It does not replace existing risk management, safety engineering, or legal compliance frameworks.

8. Recommended Use

This overview should be used as the first entry point for researchers, reviewers, standardization participants, and implementers. It should be placed near the top of the GitHub repository and linked from the six-part series, the seven PoC package, and any standards-oriented material.
