

EVA-HNS Third-Party Validation Protocol v1.0

A Reproducible Evaluation Procedure for Independent Review

Field	Value
Author	Satoru Hara / Natural Structure Works (NSW)
Version	v1.0
Status	Author-led reference document / not a formal standard
Related Corpus	Human Natural Structure Series (Six-Part Publication Set)
Date	2026-06-10

Status Notice. This document is part of the author's own research and publication program. It is not an ISO, IEC, SC42, IEEE, NIST, CEN/CENELEC, or governmental standard. It is provided as a structured reference for review, discussion, implementation planning, and future independent validation.

1. Purpose

This protocol defines a practical procedure for independent reviewers to test EVA-HNS claims under controlled conditions. It is designed to move from author-led demonstration to reproducible validation.

2. Scope

- Classification validity of the HNS five-type structural failure taxonomy.
- Auditability of EVA logs and coordinate assignments.
- Comparative output structure under baseline, guardrail, and HNS-constrained conditions.
- Post-hoc auditing feasibility without access to model weights or logits.
- Conformance checklist repeatability.

3. Experimental Conditions

Condition	Description
Baseline	Model response without HNS or special structural constraints.
General Guardrail	Model response with ordinary safety or quality instruction.
HNS-Constrained	Model response with HNS coordinate, SMS-6 grounding, and audit-log requirements.
Post-Hoc EVA	Existing output evaluated after generation using EVA-HNS criteria.

4. Test Set Design

Category	Minimum Count	Purpose
Layer Jump	20	Test unbridged transitions across meaning layers.
Category Ambiguity	20	Test confusion among subjective/objective and necessary/contingent claims.
Scope Drift	20	Test departure from the requested scope.
Metaphor Contamination	20	Test figurative language treated as literal structure.
Unsupported Causality	20	Test causation asserted from association or sequence.

5. Reviewer Requirements

- At least three independent reviewers should score the outputs.
- Reviewers should be blind to experimental condition when feasible.
- Reviewers should receive a short scoring manual defining each HNS failure type.
- Disagreements should be resolved only after initial independent scoring is recorded.

6. Scoring Metrics

Metric	Definition
Failure Detection Rate	Percentage of seeded or observed failures correctly identified.

False Flag Rate	Percentage of acceptable outputs incorrectly flagged.
Coordinate Assignment Rate	Percentage of outputs assigned HNS-36/144/864 coordinates.
Audit Log Completeness	Percentage of outputs with complete EVA audit records.
Inter-Rater Agreement	Agreement among reviewers, preferably Cohen/Fleiss kappa or equivalent.
Condition Delta	Difference between baseline, guardrail, and HNS-constrained outputs.

7. Required Evidence Package

- Prompt set and task metadata.
- Raw model outputs.
- Reviewer scoring sheets.
- EVA audit logs.
- Conformance checklist outputs.
- Summary statistics and limitations statement.

8. Reporting Template

1. State models, versions, dates, and inference settings.
2. Describe prompt generation and selection criteria.
3. Report scores by condition and failure type.
4. Report inter-rater agreement and unresolved disagreements.
5. Include at least ten worked examples with full EVA logs.
6. State limitations and threats to validity.

9. Minimum Validation Target

A first independent validation should not aim to prove universal safety. The initial target should be narrower: demonstrate that independent reviewers can use EVA-HNS to produce reproducible classifications, coordinates, and audit records with acceptable agreement.
