

Human Natural Structure Series — Preamble

Version 1.0 (2026)

Author: S. Hara

The Human Natural Structure (HNS) Series defines the structural, observational, and analytical architecture of the Human Natural OS—a unified operating system for understanding human, social, and civilizational phenomena.

The series consists of three normative specifications:

HNS-36 — Foundational Specification (Coordinate System)

Defines the universal 36-cell coordinate system formed by the intersection of six Human Natural Layers and six Abstract Cognitive Categories. It establishes the positional framework upon which all observation and analysis depend.

HNS-144 — Observational Specification (Multiaxial Observation Framework)

Defines the 144 observational configurations generated by applying depth and resolution axes to the 36-Matrix. It provides the structural method for observing phenomena without interpretive distortion.

HNS-864 — Analytical Specification (High-Resolution Analytical Framework)

Defines the analytical engine of the Human Natural OS, consisting of six analytical modes applied across depth and resolution axes. It generates 864 analytical configurations that reveal causal mechanisms, systemic dynamics, and cross-layer interactions.

Together, these three specifications form a layered OS architecture:

HNS-36 — Structural Layer (Coordinate System)

HNS-144 — Observational Layer (Observation Engine)

HNS-864 — Analytical Layer (Analytical Engine)

This layered structure ensures that all human-related phenomena can be positioned, observed, and analyzed with reproducible precision. The series eliminates interpretive drift, causal misidentification, and scale confusion by enforcing strict structural boundaries across layers, categories, depth tiers, and analytical modes.

The HNS Series is normative. Each specification defines mandatory structures and constraints. Implementations claiming conformance to the Human Natural OS must adhere to the definitions and boundaries established across all three documents.

The HNS Series is designed for researchers, analysts, institutional architects, systems theorists, and practitioners working with human, social, or civilizational systems. It provides a unified structural foundation for observation, analysis, modeling, and systemic understanding.
